Attention: Mr. Jack Marsh, Director of Public Works

**RE: ON-GOING MONITORING
WEST QUESNEL LAND STABILITY STUDY**

1.0 INTRODUCTION

The purpose of this letter is to provide the City of Quesnel (CoQ) with an update of the on-going monitoring of slope inclinometer (SI) measurements, water level measurements, precipitation data and BC Gas GPS survey hubs for the West Quesnel Area.

2.0 SI READING SCHEDULE

Since installation and initial survey of the seven SI installations in the late fall of 2000, AMEC has conducted 12 subsequent readings (except SI 5 where 13 sets of readings have been conducted) of the remaining functional installations, SI-1, SI-2, SI-5 and the upper slip surface of SI-7. The latest set of readings was conducted on 2 December, 2003.

Table 1 summarizes the SI reading schedule to date:

Table 1: SI Monitoring Schedule

SI	SI-1	SI-2	SI-3	SI-4	SI-5	SI-6	SI-7
Location	Avery Lane	Avery Lane	Abbott Drive	Voyager School	Abbott Drive	Dixon Street	Pierce Crescent
Depth SI Read to (feet/m)	142 ft 43 m	244 ft 74 m	334 ft 102 m	504 ft 154 m	474 ft 144 m	502 ft 153 m	410 ft 125 m
Spiral Reading	11 Jun. 2001	11 Jun. 2001	12 Jun. 2001	11 Jun. 2001	12 Jun. 2001	11 Jun. 2001	12 Jun. 2001
Initial Reading Date	21 Nov. 2000	21 Nov. 2000	21 Nov. 2000	3 Nov. 2000	28 Oct. 2000	22 Nov. 2000	22 Nov. 2000
Reading 1	7 Dec. 2000	7 Dec. 2000	6 Dec. 2000	24 Nov. 2000	24 Nov. 2000	6 Dec. 2000	7 Dec. 2000

Reading 13	blocked	blocked	blocked	blocked	2 Dec. 2003	blocked	blocked

- * The SI casing was blocked at a depth of 68 m, continue to measure the upper slip surface above 68 m.

3.0 SI READING RESULTS

Attached in Appendix A are the results of the SI readings to date. The SI readings are generally presented in incremental and cumulative plots with a 50 mm and 100 mm horizontal displacement scale versus depth. The incremental plots show the individual changes in inclination of the casing at each reading depth. The cumulative plots are constructed by adding together the incremental changes starting from the bottom of the installation and show the overall apparent lateral movement of the SI casing at each depth relative to the lateral position of the bottom of the casing.

Two channels (directions) of readings are presented: A and B. The A channel is oriented to be "down slope" whereas the B channel is "across slope". The actual orientation of each of the casings is shown on previously supplied mapping. Positive movements on the cumulative plots are down slope on Channel A and across the slope to the right when looking downhill for Channel B.

Table 2 presents AMEC's observations based on the data gathered to date. Figure 1 shows the locations of the slope inclinometers, along with their displacements as of December 2003.

Table 2: Slope Inclinometer Casing Displacement - Dec. 2000 to Dec. 2003

Installation No.	Location	Casing Displacement (mm)		Interpretation	Notes
		(A) Max. Down Slope	(B) Max. Across Slope		
SI 1	Avery Lane	24	20	sliding at 26 and 40 m depths	
SI 2	Avery Lane	93	8	sliding at 42 and 60 m depths	
SI 3	Abbott & Bettcher	62*	10*	sliding at 39 m	Casing blocked at 39 m between May 2002 and Nov 2002
SI 4	Voyageur School	60*	8*	sliding at 51 m	Casing blocked at 51 m between May 2002 and Nov 2002
SI 5	Abbott Drive	105	35	sliding at 37 m	Casing compression, 37 to 92 m
SI 6	Dixon Street	60*	3*	sliding at 28 m	Casing blocked at 51 m between Nov 2001 and May 2002
SI 7	Lewis & Pierce	77*	25*	sliding at 27 m and 68 m depths	Casing blocked at 68 m between May 2002 and Nov 2002, will continue reading casing above 68 m depth to monitor slip surface at 27 m depth

* Displacements are reported until last reading prior to the SI being blocked

Included in Appendix B are horizontal displacement versus time (velocity) plots. Velocity plots are given in the downhill A channel direction (positive displacements indicate movement toward the east, and negative toward the west) and in the cross slope B channel direction (positive displacements indicate movement toward the south and negative displacements toward the north). Review the velocity plots included in Appendix B indicate that SI movements appear to have slowed over 2003.

The following notes should be read while reviewing the SI data presented in Appendix A:

- A second set of plots for SI-5 has been included with the readings previous to 3 April 2001 omitted to eliminate the wave like profile (casing compression) observed in the raw data. This plot may present a clearer representation of how much of the SI deformation may be attributable to lateral ground movement, as opposed to vertical compression of the casing.
- A second set of plots has been included for SI-7 for the portion of the borehole above 68 m which can be still monitored, but these plots do not reflect movements that are likely occurring below 68 m depth.

3.0 PIEZOMETER INSTALLATION AND MONITORING

Table 3 summarizes the previous standpipe and vibrating wire piezometer installation details for the study area.

Table 3: Standpipe and Vibrating Wire Piezometer Installation Details

BH	BH-2A	BH-3A	BH-4A	BH-4A	BH-6A1	BH-6A2
Location	Avery Lane	Abbott Drive	Voyager School		Dixon Street	
Installation Type	Standpipe	Vibrating Wire Piezometer	Standpipe	Vibrating Wire Piezometer	Standpipe	
Date of Completion	2 November, 2001	15 November, 2001	6 December, 2001		18 December, 2001	
Screen Depth/Tip Depth*	54.2 m to 60.2 m	38.0 m	39.6 to 39.9 m	49.0 m	44.0 to 45.2 m	26.4 to 27.8 m
Type of Casing Protector	Stick-up	Stick-up	Stick-up	Stick-up	Flush-Mount	
Casing Stick-up	800 mm	N/A	860 mm	N/A	N/A	

* Depths are measured from ground surface. Screen depth is for standpipes, depth to tip is for vibrating wire piezometers.

The standpipes were monitored during routine visits to Quesnel. The standpipe monitoring schedule is shown in Table 4:

Table 4: Standpipe Piezometer Monitoring

Reading 15	18 Nov. 2002			
Reading 16	19 Jun. 2003			
Reading 17	25 Nov. 2003			

The vibrating wire (VW) piezometers were sealed in the boreholes and an electronic minilogger monitored the pore-water pressures. The VW miniloggers were programmed to take daily pore water pressure readings from the date of completion. Refer to Appendix C for graphs displaying the water levels from the standpipes (2A and 6A) and VW piezometers (3A and 4A) recorded to date. There appears to have been a small decrease in the water elevations (less than a 100 mm) in VW 3A since AMEC has begun pump tests for the pilot dewatering program during the fall of 2003, while VW 4A has shown no change.

VW 4A

Additional wells were installed as part of pump testing for the pilot dewatering program. Data collected from these additional well will be reported on separately.

4.0 PRECIPITATION

The monthly total precipitation data was obtained from Environment Canada for the Quesnel Airport. Plots of the recorded data through 1975 to 2003 are shown in Appendix D along with historical data and the cumulative difference. The historical data is based on a 30 year moving mean, where an average over 30 years was calculated for each month beginning with 1975. To calculate the thirty year moving mean for 1975, data was taken back to 1946 and all the monthly values were averaged over that 30 year interval. The cumulative difference is the sum of difference between the recorded data and the historical mean beginning with January 1975 and ending December 2003. This plot shows the trend of the recorded precipitation whether it is increasing or decreasing (i.e. wetter or drier trends) compared to the historical mean.

The precipitation data indicates that the period from 1975 through the spring of 1988 was close to or slightly below average. From the spring of 1988 through the end of 1996, conditions tended to be much drier than normal, with 1991 being close to average. From the spring of 1996 to the fall of 1997, conditions tended to be much wetter than normal. From 1998 to the summer of 2002 conditions have appeared to be close to average. Over 2003 the conditions appeared to have been slightly drier than average. The drier trend in 2003 is likely the cause for the slower SI movements recorded over the last year.

5.0 MOVEMENT HUBS

BC Gas provided AMEC with survey data from ongoing semi-annual monitoring of GPS Movement Hubs, which were installed in September of 1998 in the study area. Data was also provided from additional movement hubs installed during December of 2001. Figure 1 shows the locations of the BC Gas movement hubs and the associated horizontal displacement vectors over three periods:

1. From September 1998 to November 2003.

2. From December 2000 to November 2003 (this period roughly corresponds to the period AMEC has been monitoring the SI's)
3. From December 2001 to November 2003 (monitoring of additional hubs installed during December 2001)

These three periods were chosen so that movements over time periods similar to when the slope inclinometers were in place could be compared.

Table 5 below summarizes the movement hub data collected to date. Appendix E contains the BC Gas movement hub data over the monitoring periods.

Table 5: BC Gas Movement Hub Data to November 2003

Movement Hub	Date Installed	Horizontal Displacement Magnitude (mm)	Horizontal Displacement Vector* (%)
2	September 1998	252	101
4	September 1998	208	57
5	September 1998	222	91
6	September 1998	267	45
7	September 1998	219	64
8	September 1998	206	66
9	September 1998	276	92
14	September 1998	259	95
15	September 1998	196	77
16	September 1998	140	77
17	September 1998	300	99
18	September 1998	259	99
19	September 1998	235	106
20	September 1998	223	107
21	September 1998	128	111
22	September 1998	32	108
23	September 1998	20	87
30	December 2001	61	107
31	December 2001	86	91
32	December 2001	17	193
33	December 2001	44	108
34	December 2001	62	111
35	December 2001	21	161
36	December 2001	10	53
37	December 2001	68	101
39	December 2001	42	135
40	December 2001	35	92

Displacement vectors displaying the movements to the most recent survey provided by BC Gas of November 2003 have been included on Figure 1, in addition to the SI displacements. Refer to Appendix E for Chart E1 of the survey hub cumulative displacements over the total monitoring period. Generally the survey hub movements appear to have slowed over the last monitoring period from October 2002 to November 2003.

5.0 FUTURE WORK

Given the nature of the movements observed to date, AMEC recommends continued monitoring of the operable SI installations, with the next set of readings being conducted in the early spring of 2004. Given that the majority of SI's have been sheared in the Uplands Area, AMEC suggests that an additional SI installation be installed either at Voyageur School or in the central portion of the study area. Note that any new SI should be installed to a depth of at least 10 m past the previously recorded lowest slip surface, rather than the full depth of the original installation. This installation would replace one of the 6 new installations recommended in AMEC's final report of 25 October, 2002.

5.0 CLOSURE

Thank you for the opportunity to provide assistance in this matter. Please do not hesitate to contact the undersigned at 1-250-564-3243 should you have any questions or require further information.

Respectfully submitted,
